Westgate
CYBER SECURITY

## Instantly deploy secure private networks in fast-changing environments.

Organisations build virtual castles to defend themselves online because the Internet can be hostile. But what happens when you have to work with people or systems which don't live inside your castle?

Creating secure network connections between separate organisations or environments can be extremely painful. Hours, even days can be required to setup connections which might only be needed for short periods of time. We make secure network connections instant and painless.

We believe secure networks should be a utility;
Always available, easy to obtain, and invisible at the point of use.

Our software solution, **Enclave** turns complicated virtual private network technology into a transparent on-demand utility.

We apply intelligence and security at the edge of the network to decouple routing and transport from encryption and authentication. This change enables overlay networks to exist which are deployable in seconds for virtually any task or purpose, without the cost, complexity and inflexibility that plagues current technologies.
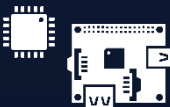

Secure IoT communication

Safely build secure communications IoT between devices with automatic end-to-end encryption which can be deployed on untrusted networks.

- Air tight security, unparalleled simplicity
  Enclave guarantees mutual authentication, and gets out of the way.

- Software defined networks
  Micro-segment networks around communities of interest, and manage your fleet of devices on a single pane of glass without having to maintain centralised infrastructure.

Instant safe access to APIs

The security benefits of a VPN without the time, complexity and cost to setup. Safely share, test and experiment with PSD2 partners.

- Improve time to market for product owners
  Provision networks and connect devices in seconds, not hours or days.

- Reduce attack surface and remove risk
  Enclave networks are invisible. Communication between endpoints is direct and peer-to-peer. Stop exposing VPNs and other sensitive systems to the Internet.

Quickly connect multiple Cloud vendors

Hassle free vendor agnostic connections between Cloud and on-premise locations for secure data migrations, or business as usual.

- Enclave networks are flexible
  Deploy around existing devices and lash disparate systems together quickly.

- No network changes needed
  Connections just work. Stand up and tear down networks without any lasting impact or configuration changes to clean-up.
